

GOLANG AND UADMIN LINUX INSTALLATION INSTRUCTIONS

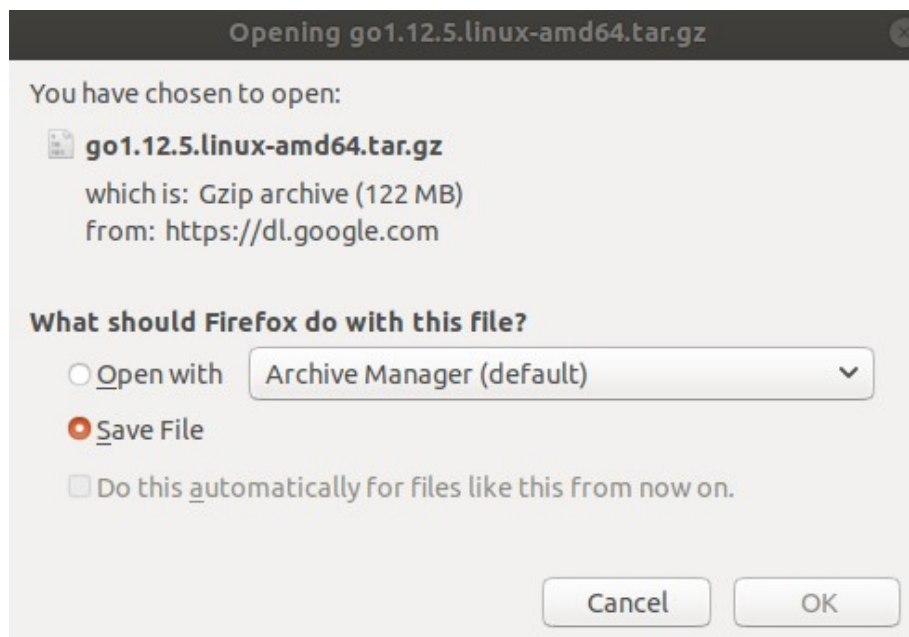

First of all, go to <https://golang.org/dl/> to install Golang.

For Linux, click the tar.gz link.

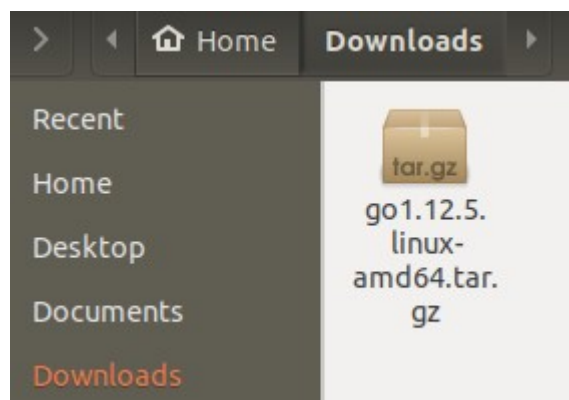

Featured downloads

Microsoft Windows <i>Windows 7 or later, Intel 64-bit processor</i> go1.12.5.windows-amd64.msi (118MB)	Apple macOS <i>macOS 10.10 or later, Intel 64-bit processor</i> go1.12.5.darwin-amd64.pkg (121MB)	Linux <i>Linux 2.6.23 or later, Intel 64-bit processor</i> go1.12.5.linux-amd64.tar.gz (122MB)
Source go1.12.5.src.tar.gz (21MB)		

In the pop-up form, choose Save File then click OK button.

Ensure if the Golang package was saved in Downloads folder.

Open your Terminal. Go to Downloads folder by typing “cd Downloads” from Home then extract it into /usr/local, creating a Go tree in /usr/local/go.

```
sudo tar -C /usr/local -xzf go1.12.5.linux-amd64.tar.gz
```

Add /usr/local/go/bin to the PATH environment variable. In order to do that, open profile in Home directory by typing this command:

```
sudo nano .profile
```

Then on the most bottom part, add **export PATH=\$PATH:/usr/local/go/bin**

Note: changes made to a profile file may not apply until the next time you log into your computer.

To apply changes immediately, open your Terminal and run this command.

```
export PATH=$PATH:/usr/local/go/bin
```

Now test if your Golang is already installed in your computer by typing this command in your terminal:

```
go
```

Result

Go is a tool for managing Go source code.

Usage:

```
go <command> [arguments]
```

The commands are:

bug	start a bug report
build	compile packages and dependencies
clean	remove object files and cached files
doc	show documentation for package or symbol
env	print Go environment information
fix	update packages to use new APIs
fmt	gofmt (reformat) package sources
generate	generate Go files by processing source
get	download and install packages and dependencies
install	compile and install packages and dependencies
list	list packages or modules
mod	module maintenance
run	compile and run Go program
test	test packages
tool	run specified go tool
version	print Go version
vet	report likely mistakes in packages

Use "go help <command>" for more information about a command.

Additional help topics:

- buildmode build modes
- c calling between Go and C
- cache build and test caching
- environment environment variables
- filetype file types
- go.mod the go.mod file
- gopath GOPATH environment variable
- gopath-get legacy GOPATH go get
- goproxy module proxy protocol
- importpath import path syntax
- modules modules, module versions, and more
- module-get module-aware go get
- packages package lists and patterns
- testflag testing flags
- testfunc testing functions

Use "go help <topic>" for more information about that topic.

=====

Before we proceed to uAdmin installation, let's install the prerequisite softwares first which are the following:

- > Git
- > GCC

If **Git** is not installed, you will get this result.

go: missing Git command. See <https://golang.org/s/gogetcmd>

package github.com/uadmin/uadmin/...: exec: "git": executable file not found in \$PATH

First, update your default packages.

sudo apt update

Now install Git.

sudo apt install git

Confirm your Git installation.

git --version

Result

git version 2.17.1

If **GCC** is not installed, you will get this result.
github.com/mattn/go-sqlite3
exec: "gcc": executable file not found in \$PATH

To install GCC, run this command in your terminal.

sudo apt install gcc

You can learn how to install GCC on Ubuntu with examples here:
<https://linuxide.com/linux-how-to/how-install-gcc-ubuntu-examples/>

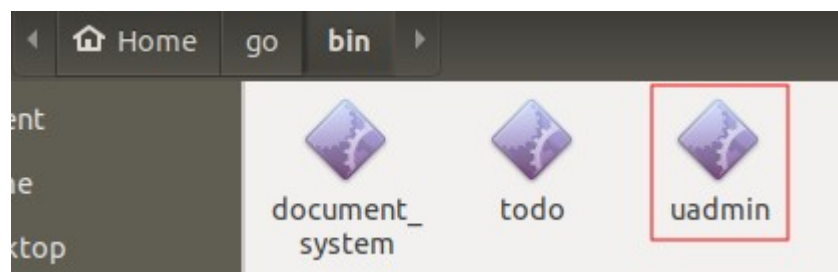

Now let's install uAdmin. Type the following command in the terminal as shown below. This might take a long time process because this command also installs dependencies.

go get -u -v github.com/uadmin/uadmin/...

If you go to home/yourPCname/go/src/github.com, you will notice that the uAdmin packages are saved in that path.

From Home directory, go to go/bin path. Ensure that you have **uadmin** file inside it.

In your terminal from Home directory, open profile by typing this command

sudo nano .profile

Then on the most bottom part, add two lines of code in it.

```
export GOPATH=$HOME/go  
export PATH=$PATH:$GOPATH/bin
```

Note: changes made to a profile file may not apply until the next time you log into your computer.

To apply changes immediately, open your Terminal and run these commands (press Enter on your keyboard after each line).

```
export GOPATH=$HOME/go  
export PATH=$PATH:$GOPATH/bin
```

Now test if your uAdmin is already installed in your computer by typing this command in your terminal: **uadmin**

Result

Usage: uadmin COMMAND [-e email] [-d domain]

This tools allows you to publish your project online

Commands:

publish	This publishes your project online
prepare	Generates folders and prepares static and templates
version	Shows the version of uAdmin

Arguments:

-e, --email Your email. This is required for you to be able to maintain your project.

-d, --domain You can choose your domain name which will customize your URL

Get full documentation online:

<https://uadmin.readthedocs.io/en/latest/>

=====

Congrats, now you know how to install Golang and uAdmin framework from scratch.
